

[Aberration]

[You are a slimy tentacle boi, like a big meatball with two beeg tentacle arms and 2 (or more) tentacle legs? Or maybe something a *little* more humanoid? Idk, I'll figure it out eventually. You have some psychic abilities, and at higher levels, you can float off the ground a few inches maybe?. Eventually, maybe get telekinesis? And a feature that allows you to ooze potion effects out of yourself to share with others. Also, darkvision lel]

As a [aberration], you have the following racial traits.

Ability Score Increases

When determining your character's ability scores, increase one score by 2 and increase a different score by 1, or increase three different scores by 1. Follow this rule regardless of the method you use to determine the scores, such as rolling or point buy. The "Quick Build" section for your character's class offers suggestions on which scores to increase. You can follow those suggestions or ignore them, but you can't raise any of your scores above 20.

Languages

Your character can speak, read, and write Common and one other language that you and your DM agree is appropriate for the character. The [Player's Handbook](#) offers a list of languages to choose from. The DM is free to modify that list for a campaign.

Creature Type

You are an Aberration.

Size

You are Small or Medium; you choose when you make your character.

Speed

Your walking speed is 30 feet.

[Trait 1]

Insert something fun and interesting here. :Smile:

Magnus (Class Changes)

The Magnus class is MOSTLY figured out, I believe. Potential changes come down to two elements:

1. The addition of a new feature at 1st level (or inclusion in a pre-existing one) of the ability for Magnus to take the Elemental Adept feat and use it for their element, regardless of if they meet prerequisites or if their element is one compatible with Elemental Adept. This concept may get scrapped or just mentioned in a dev note for DMs to be able to choose if they want to allow it, I'm not sure. Haven't fully considered the balancing and feature distribution ramifications of this yet.
2. Derivatives. I'm not entirely happy with all the base Derivative features. I feel like some of them work well, but others fall short of my standards. Likely, some of these will be changing (like Nature, which is a glorified Weapon Mastery Property and is less enticing when you can just switch weapons to get the effect when you want), but others will stay the same.

I've removed most of the base class from this document, leaving only the 11th level Derivative feature for ease of reference.

Derivative

At level 11, you gain a Derivative. Particularly strong Magni develop their powers beyond their initial Integration. For these Magni, their Integration splits, granting them abilities previously beyond the scope of their normal Integration. Referred to as a Derivative, this offshoot often takes on similar capabilities of other Integrations, though some Magni find their Derivative is very similar to their Integration and strengthens their already-existing abilities.

When you gain your Derivative, you can pick one of the following options; you gain the listed feature. Your Derivative improves at 14th and 18th levels, conveying further benefits. Each Derivative also lists its associated damage type or types in parentheses.

Corrosion (Acid)

Ruthless Vitriol

When you make a weapon or unarmed strike, or you deal acid damage from a different source than this feature, you can cause acid to splash forth, burning your enemies. The targeted creature and any enemies within 5 feet of it take acid damage equal to your Augmentation modifier (minimum 1), regardless of whether the attack hits.

Corruption (Necrotic)

Consumer of Light

As an Action, you can select a point within 60 feet and engulf an area in total darkness; a sphere of darkness with a radius of 20 feet emerges. Only creatures who can see in magical darkness or have blindsight or truesight can see through it. As part of the Action to create this bubble, you can grant yourself and a number of creatures within 60 feet equal to your Augmentation modifier the ability to see up to 90 feet in darkness, both magical and nonmagical. You can create a bubble of darkness in this way a number of times equal to your Augmentation modifier (minimum 1); you regain all expended uses after completing a long rest. The bubble, along with the special darkvision conferred along with it, last for 1 minute or until you are incapacitated, whichever comes first.

You can expend a use of this feature as a Bonus Action to grant the special darkvision without having to create a bubble of darkness. When used in this way, the darkvision lasts for 1 hour.

Electricity (Lightning)

Chain Lightning

When you hit a target with a weapon or unarmed strike, or you deal lightning damage from a different source than this feature, you can cause lightning to chain from creature to creature. You can deal lightning damage equal to your Augmentation modifier (minimum 1) to the target and an additional number of creatures up to your Augmentation modifier (minimum 1); each creature must be within 10 feet of another one targeted by the lightning.

Flame (Fire)

Soul Ignition

When you hit a creature with an attack roll or deal fire damage to them, you can light a spark inside them [and mark them]. Until the start of your next turn, if you or an ally reduce that creature to 0 hit points, the creature explodes, dealing 4d8 fire damage to any creature within a 10-foot radius of them. Creatures within the area can attempt a Dexterity saving throw against your Augmentation DC; on a success, they take half damage. [A creature marked by this ability takes 1d4 fire damage at the end of its turn while it is marked.]

Frost (Cold)

Frigid Shelter

When a creature within 30 feet of you takes damage, you can use your reaction to create a shield of ice and attempt to protect them. The creature gains a number of temporary hit points equal to your Magnus level plus your Augmentation modifier; these temporary hit points are applied to the creature before the damage is applied, and they last for one minute. You can also grant these temporary hit points as a Bonus Action on your turn. You can use this feature a number of times equal to twice your Augmentation modifier (minimum 1, for a total of at least 2 uses); you regain all expended uses on a long rest.

Gravity (Force)

The Invisible Hand

You can affect the gravitational pull around objects that aren't being worn, carried, or otherwise held in place. Once per turn, as a Bonus Action or in place of one of your attacks when you take the Attack Action, you can target one of these unattended objects within 30 feet and cause it to fly in a straight line; the object cannot weigh more than 15 times your Augmentation score. (*Note: Your Augmentation score is the ability score of whichever ability score your Augmentation modifier is based on.*) You can move this object aggressively, causing it to deal force damage to it and whatever target it hits, or you can move it softly, allowing someone to be able to grab or otherwise interact with it freely. When you choose to use this feature aggressively, a creature can attempt a Dexterity saving throw to avoid the object; the damage dealt is equal to a roll of a number of d8's equal to your Augmentation modifier (minimum 1, for a total minimum of 3) + your Augmentation modifier.

Light (Radiant)

Blinding Radiance

[As a Bonus Action, you can burst forth with light; enemies within 30 feet must make a Constitution saving throw or be blinded for one minute. An afflicted creature can repeat the saving throw at the end of its turn, ending the effect on a success. You can use this light a number of times equal to twice your Augmentation modifier (minimum 1); you regain all expended uses on a long rest.]

[As a Bonus Action, you can burst forth with light, channeling it through your strikes. Once per turn, whenever you hit a creature with a melee attack, you can force them to make a Constitution saving throw. On a fail, the creature becomes blind for one minute. A creature blinded in this way can repeat the saving throw at the end of each of their turns, ending the effect on a success. You can use this feature a number of times equal to your Augmentation modifier. You regain one use on a short rest, and you regain all expended uses on a long rest. If your Integration is also Light, you may expend a Radiant Die to regain a use of this feature (no action required).]

You can instead expend a use of this feature as a Bonus Action to stabilize a dying creature you can see within 30 feet.

Nature (Bludgeoning, Piercing, Slashing)

Concussive Aftershock

When you hit a creature with a weapon or unarmed strike or successfully grapple or push them, you can choose to follow it up with a secondary blast while they are unbalanced. The target must make a Constitution saving throw; on a fail, they are knocked prone.

Psionics (Psychic)

Psionic Barrier

As a reaction, you can attempt to interpose psionically between a creature and an attack or effect they have been subjected to. When a creature within 30 feet of you is hit with an attack roll or fails a Dexterity saving throw, you can use a reaction to grant them the benefits of partial cover. They are counted as being in three-quarters cover for the triggering effect, potentially turning the hit into a miss or the fail into a success. Until the start of your next turn, they retain the benefits of half cover for further attacks and saving throws.

Sound (Thunder)

War Horn

When you take the Attack Action, you can replace one of your attacks and blast forth soundwaves to devastate your enemies. Creatures within a 20-foot cone, originating on you, must make a Constitution saving throw; on a fail, they take 3d10 thunder damage and are deafened. On a success, they take only half damage and are not deafened. The deafened condition from this feature lasts for one minute; a creature can attempt a Constitution saving throw at the end of their turn to end the effect on a success.

Toxin (Poison)

Venomous Strike

Whenever you give a creature the poisoned condition, they take 1d6 poison damage at the start of each of their turns while they are poisoned.

Additionally, when you hit a creature that with an attack that isn't a ranged spell attack, you can force them to be poisoned for 1 minute; they can make a Constitution saving throw at the end of each of their turns, ending this effect on a success. You can do this a number of times equal to your Augmentation modifier (minimum 1), regaining all expended uses on a long rest.

Magnus Integrations (Subclasses)

At 1st level as a Magnus, you choose an Integration. This grants you features at 1st level, and then again at 6th, 10th, and 15th levels. The available Integration options are listed below.

Frost (Cold)

You wield the chilling power of frost. Ice runs through your veins, granting you abilities that send shivers down the spine of any who oppose you.

Clinging Frost

Starting at level 1, when you hit an enemy with an attack, their movement speeds are each decreased by 10 feet until the end of their next turn as frost clings to them, chilling them and weighing them down.

Icy Touch

Beginning at level 6, your weapon attacks deal an additional 1d6 cold damage. When you hit the same target twice in a turn, their movement speed is reduced by 20 feet, instead of the 10 feet it normally would be.

Frost Armor

Starting at level 10, you gain access to frost armor. As an Action, you can don or doff it, causing ice to creep up and cover you and your armor. While your frost armor is active, your AC is equal to 14 + your Dexterity modifier or your typical armor AC, whichever is higher. When an enemy hits you with a melee attack while it is active, they take 1d6 cold damage per hit, and their speed is reduced by 5 feet per hit until the end of their next turn. Additionally, while your frost armor is active, your melee attacks trigger Icy Touch twice, as though you had hit the target a second time—they take 2d6 cold damage instead of 1d6, and they take the 20-foot movement speed reduction.

Deep-Freeze

At level 15, your power has grown to a point that it manifests visibly around you. While your frost armor is active, the area within 15 feet of you is frosty and the air is dense, functioning as difficult terrain. You and your allies gain a +1 to AC, as the frost in the air tries to impede your enemies' attacks. Additionally, enemies you hit within this aura have their movement speed reduced by 20 feet per hit until the end of

their next turn, instead of the 10 feet it would normally be; if it is a melee attack, the speed reduction increases to 40 feet and the damage from your Icy Touch increases to 4d6. This replaces the Icy Touch buff from your level 10 feature.

As an Action while your frost armor is active, you can send out a pulse of frost. Each enemy within your frost aura must make a Constitution saving throw or be restrained until it is no longer in your aura; a creature restrained in this way can make a Strength saving throw as an Action to break free. A creature restrained in this way that is subjected to another frost pulse becomes paralyzed if it fails again; it can make a Constitution saving throw at the end of each of its turns to return to a restrained state instead. If a creature paralyzed by this effect is subjected to another frost pulse and fails its save against it, it becomes petrified. A creature petrified in this way is frozen solid and does not thaw for 30 days, regardless of if it stays in your aura. Many weaker creatures may even outright die (subject to your DM's discretion).

Nature (Bludgeoning, Piercing, Slashing)

The power you wield embodies the physical aspects of nature. The rumbling earth, the crashing waves, a biting breeze, a grasping vine—these all harmonize with your very being, and they will heed your call.

Ensnaring Reach

Starting at level 1, you can attempt to grapple a target using your Integration. When you replace an attack with a grapple attempt, you can target any creature within 30 feet instead of your normal reach, using your Augmentation modifier instead of strength, and you do not need a free hand. If you successfully grapple a target in this way, they are also restrained for one minute or until they break free from the grapple. You can only target one creature at a time in this way, and you must maintain concentration on it, as though it were a spell.

Crushing Grip

Starting at level 6, when you substitute an attack with a push attempt, you can target a creature within 30 feet instead of your normal reach; you do not need a free hand for this. This push attempt uses your Augmentation modifier instead of strength, and the target can be moved up to 10 feet in any direction if you succeed.

Also, whenever you successfully grapple or push a target, they take 1d6 + your Augmentation modifier (minimum 0) damage; you can pick whether the damage type is bludgeoning, piercing, or slashing damage each time you succeed on a grapple.

Finally, whenever you deal bludgeoning, piercing, or slashing damage, the damage counts as magical for the purposes of overcoming resistances or immunities to bludgeoning, piercing, or slashing damage; this applies to any resistance to those types, not just nonmagical variants.

Unyielding Resolve

Beginning at level 10, you have learned to split your attention to deal with more than one problem at a time. Once per turn, when you use your Ensnaring Reach or Crushing Grip features to attempt a grapple or push, you can target a second creature within 30 feet, using either of those; you do not have to use

the same feature for both. You can concentrate on grappling two targets in this way now; losing concentration causes both targets to become free.

Additionally, you can ignore size restrictions whenever you attempt to grapple or shove. While a creature is grappled by you, they take 1d6 + your Augmentation modifier (minimum 0) damage at the start of their turn; you can choose whether it is bludgeoning, piercing, or slashing each time you deal this damage.

Natural Disaster

Starting at level 15, you have attuned to your environment and can tap into the disastrous potential of nature. Harnessing the bitter cold of blizzards, the harshness of a sandstorm, or the rage of a tsunami, you unleash devastation around you. For the next minute, the area within 20 feet of wherever you are is difficult terrain for creatures of your choice. These creatures also take 2d8 damage of bludgeoning, piercing, or slashing (you pick when they take damage) at the start of their turn while within the area, and you do not need to concentrate on your grapples while the target is within your aura. Your grappled targets take an additional 2d8 damage when they start their turn in your aura. This effect ends early if you become incapacitated.

Additionally, your Defensive Component improves; you gain resistance to bludgeoning, piercing, and slashing damage and no longer need to choose one at the end of a long rest.

Sound (Thunder)

The power you wield resonates around you. With every footfall, every clash of a sword, every war cry, your arsenal grows—for what can exist without making a sound that you can turn against its creator?

Subito

Starting at level 1, you can affect the volume of sounds around you. When a creature within 30 feet casts a spell with a verbal component or uses an Action or Bonus Action that requires them to vocalize audibly (such as a war cry, a taunt, or a roar—something that requires the use of their voice), you can use a reaction to deal 1d8 thunder damage to them.

Additionally, while not in combat, you can muffle sounds of your choice within 30 feet; this grants you and allies within range advantage on stealth checks that involve being quiet. This does not entirely eliminate the sound; it simply makes it quieter. You can also amplify sounds for yourself, granting advantage on perception checks that involve listening; if you are in an environment that is particularly noisy, however, the additional noise may make it difficult to hear what you are listening for, canceling out the advantage.

Echoing Blows

Starting at level 6, whenever you make an attack, you can deal 1d8 thunder damage to enemies within 5 feet of you and push them away from you by 5 feet. Afflicted creatures can make a Constitution saving throw; on a success, they take half damage and are not pushed back. This echo occurs after the effects of your attack, regardless of if it hit or missed.

Thunderous Echo

At level 10, your echoing blow improves. The damage improves to 2d8 thunder damage, the range increases to within 15 feet of you, and failing the saving throw now also deafens enemies for one minute. An enemy deafened in this way can repeat the saving throw at the end of its turn, ending the effect on a success.

Additionally, when you use the reaction from your Subito feature, you may add your Augmentation modifier to the thunder damage dealt.

The Sounds of War

Beginning at level 15, you can freely weaponize any sound within 30 feet of you. While you are not incapacitated or in a zone of magically-induced silence, creatures of your choice automatically take 3d8 thunder damage at the start of their turn.

Additionally, when you see or hear a creature casting a spell with a verbal component, you can attempt to turn their magic back on them. As part of the reaction from your Subito feature, you can make an ability check using your Augmentation modifier (minimum 1) and your proficiency bonus—the DC is equal to 12 plus the spell's level. On a success, the spell they were casting turns against them; if it was a defensive or utility spell, it fails and has no effect, while an offensive one instead targets them or the area immediately around them, centered on the spellcaster. You can use this feature a number of times equal to your Augmentation modifier (minimum 1), regaining all expended uses on a long rest.

Toxin (Poison)

You wield power over the subtlest of killers. While the power of flames is an externally destructive force, yours is a force of death, capable of infesting the bodies of those you touch and tearing them apart from the inside out.

Touch of Death

Beginning at 1st level, you have learned a way to infuse every blow with poisons from your body. Your weapon and unarmed attacks deal an additional 1d4 poison damage on a hit. This damage increases at higher levels: you deal an additional 1d6 at level 5, 2d8 at level 9, 2d10 at level 13, and 3d12 at level 17.

Incurable

Starting at level 6, your personal poisons develop into a poison unique to you. When you deal poison damage to a creature, you can ignore resistance to it, and enemies with immunity to poison are treated as though they only have resistance, taking only half damage instead of being completely immune.

Also at 6th level, you gain immunity to your own poisons and advantage on saving throws against the poisoned condition from other sources.

Give and Take

Beginning at level 10, when you hit an enemy with a weapon or unarmed attack, the target of your attack must make a Constitution saving throw or be poisoned. When you attempt to give a creature the

poisoned condition that is immune to it, they are treated as though they are not immune; however, they gain advantage on any saving throws to resist or end it.

Additionally at 10th level, you can use an Action to draw out poisons and poison-like substances from those within 30 feet of you. This removes any poisons from their system and clears away the poisoned condition if they have it.

Omen of Pestilence

Starting at level 15, as an Action, you can unleash a cloud of your unique poisons. This mostly-transparent cloud occupies a sphere with a 15-foot radius and extends around total cover. The cloud lasts for up to ten minutes and is stationary, unless you take a Bonus Action to move it up to 30 feet. You can only have one cloud active at a time, and you can dissipate the cloud at any point.

Enemies that start their turn within the cloud take 3d12 poison damage; they must then make a Constitution saving throw or become poisoned, ignoring immunity to the poisoned condition. A creature that leaves the cloud can repeat the saving throw as an Action on any of their turns to attempt to end the effect; otherwise, the poison lasts within their body for 1 minute, refreshing each time they go into the cloud again.

Corruption (Necrotic)

The power you wield is referred to by many names; to some, it is the darkness that swallows the light. It is the chaos that will not be tamed—the unyielding entropy—an endless hunger that will not be sated. You hold power over a force that is capable of corrupting all that you would see destroyed.

[Feature *ideas*: corrupted mind (EG crown of madness), corrupted reality (breaks some kind of core rule in a way that would benefit players?—possibly something to do with resurrection, or allowing temp HP to stack and granting allies temp hp each turn equal to damage drained from nearby enemies??), corrupted body (can resurrect enemies as zombies as a reaction limited number of times)]

[Corrupted Mind]

Beginning at 1st level, your power has the ability to tear away at the minds of those around you. As a Bonus Action, you can target a creature within 30 feet and tear away at their sanity. The target must make a Wisdom saving throw; on a fail, they take necrotic damage equal to a roll of a number of d8's equal to your Augmentation modifier, and they are afflicted with a random condition for one minute. They take damage again at the end of each of their turns for as long as they have the condition; they can repeat the saving throw at the end of each turn, prior to taking damage. You can only target one creature with this ability at a time; if you target another creature while one is already under this effect, the first effect ends immediately. You can use this feature a number of times equal to twice your Augmentation modifier, regaining all expended uses at the end of a long rest. The condition is determined by rolling on the following table. A creature who is entirely immune to the condition takes no damage and is released from this ability.

d6	Condition
1	Frightened

2	Blinded
3	Deafened
4	Poisoned
5	Blinded and Deafened
6	Turned, as per the Cleric's <i>Turn Undead</i> Channel Divinity feature

[Corrupted Body]

Starting at level 6, your strikes are empowered with a force that tears away at your foes. When you hit with a weapon or unarmed attack, you can choose to deal an additional 1d6 necrotic damage. The damaged creature must then make a Constitution saving throw. On a fail, the afflicted creature must roll 1d4 whenever they make an attack roll or saving throw and subtract it from their total. This effect lasts until the start of your next turn; a creature cannot be affected by this feature if they are already under the effects of this feature.

[Lingering Corruption]

Beginning at level 10, you can corrupt the remains of your foes, twisting them to serve you temporarily. As a reaction when you see a creature die, you can expend a use of [your level 1 feature] to create a Zombie or a Skeleton (you choose when you use this feature) from their corpse; this creature acts on your turn and does what you order (no action required). After one minute, if the creature has not died again, it drops to 0 hit points and dies; you cannot use this feature on it again. You may only have one of these minions active at any given point. Alternatively, you can use this on a creature as a reaction when they hit 0 hit points to prevent their death, returning them to 1 hit point. You cannot target that creature again in this way until it has had a long rest.

[Corruption Domain]

Starting at 15th level, you have grown so accustomed to your corrupting powers that you can temporarily warp reality itself around you. Once per long rest, you can use an Action to activate a sphere of your power within a 15-foot radius, centered on you, that moves with you. Within this area, all color fades to shades of black and white. You can target up to two creatures with each use of [your level 1 feature], as long as both are within your domain, and they remain affected as long as they end their turn within your domain. You can use your Lingering Corruption feature on any creatures within the area without expending a use, and can maintain a number of minions up to your Augmentation modifier, provided they remain within your domain; you may only have one minion outside the domain at any given point—additional minions who step outside drop to 0 hit points and die immediately. Lastly, whenever you deal necrotic damage to a creature within the domain, you and any creatures of your choice within the domain gain temporary hit points equal to the necrotic damage dealt. Unlike other temporary hit points, these are subject only to your rules; the temporary hit points are added to any the creature already has, up to a maximum of your Magnus level. This domain lasts for one minute, or until you are incapacitated—whichever comes first.

Arts Domain (*Cleric*)

I dunno, something about art or music? Features about synergies, building chords/mixing paints/ingredients, etc. Maybe dazzling and distracting enemies, entertaining others, beauty, etc?

Bastion (*Fighter*)

Bastion Fighters have spent countless hours practicing and experimenting with their shields. They are defenders, choosing to focus their time and efforts into perfecting the art of the shield rather than a traditional weapon. They are the wall, sheltering their allies and breaking the tides of the enemy; no harm shall come to those a bastion protects.

Focuses on using a shield, for both offense and defense, for player and allies; will likely take or share some features from Arsenal. Apply AC to allied saving throws? IDK, AC tank use AC for stuff. Temp HP for you? Rallying cry action/BA to grant temp HP to everyone? Taunt ability/redirect attack to you?

Unyielding Wall?

At 3rd level, you have trained extensively with your shield to become a wall, protecting your allies. You gain an additional fighting style from the following options. Each fighting style includes a modification listed beside it; as long as you have that fighting style, regardless of where you obtained it, you can choose to benefit from the modification.

Defense. The benefit increases by one (a total of +2) if you are using a shield; you can receive this bonus while unarmored as long as you have a shield.

Interception. When you use the reaction granted by this fighting style, you can add your shield's AC bonus—including any magical bonus it may have—to the damage reduction. You can also use this reaction without expending your reaction; once you use it in this way, you cannot do so again until the start of your next turn. You can do so in this way twice per turn at level 11 and three times per turn at level 17.

Protection. When you use the reaction granted by this fighting style, you can grant the creature you are protecting the benefits of half-cover until the start of your next turn, as long as you remain within 5 feet of them; this applies to the triggering attack as well. You may also trigger it as a reaction when another creature within 5 feet must make a Dexterity saving throw; they gain advantage on the save instead and may also benefit from the half-cover granted by this modification.

Keeper of Shields:

Your extensive training with shields has allowed you to access and use a variety of special shields to their maximum potential. You gain access to the following shield variants: the buckler and the tower shield. These shield variants count as shields for any feature that mentions them, though they may interact differently from the average shield. If you obtain a magic shield, you can spend 8 hours and 25 gold per level of rarity (25 GP for common, 50 GP for uncommon, 75 GP for rare, and so on) to convert it into one

of the other variants. You also gain the ability to improvise a shield, similarly to how weapons can be improvised. As usual, you may only receive the AC benefits from one shield at a time; having two different kinds of shields does not allow them to stack. The details for your shield variants and improvised shields are listed below. *Note: These shield variants are available for anyone to use, but without proper training, they function identically to a base shield. A DM can override this and offer these variants as mundane equipment for anyone with a shield proficiency if they choose, or use the variant rule Shield Variants in chapter 8 to provide more specifics for dealing with a variety of shields.*

Buckler: A buckler is a small shield, typically strapped to the arm instead of held. Due to its size, its defensive properties are lower; the AC bonus from this type of shield decreases to +1. However, you can use the free hand provided by a buckler for anything you could normally use a free hand to do, as it is designed to be unintrusive. If you make a melee attack with a weapon with the *heavy* property, you lose the buckler's AC benefit until the start of your next turn. A buckler weighs half as much as a normal shield.

Tower Shield: Tower shields are much larger and more unwieldy than your average shield. As a Bonus Action, or in place of one of your attacks when you take the Attack Action, you can brace yourself behind a tower shield you are holding. Until you move, you gain the benefits of half-cover. A tower shield weighs twice as much as a normal shield.

Improvised Shield: Improvised shields are created when an object is used to protect the holder, despite not being intended for such a purpose. An improvised shield requires at least one hand to hold, and you are considered proficient in its use, allowing you to benefit from its AC bonus if you are not already using a shield. You may use an improvised shield for any feature you have that mentions a shield, although you cannot convert it into a magic shield, or vice versa. Improvised shields are typically not as sturdy and may break during combat, becoming unusable as a shield. *While a DM may decide this at any point, a suggested way of choosing if an improvised shield breaks is to roll a d6 whenever an attack roll misses due to the shield's AC bonus—if a character would normally have a 16 AC, and their improvised shield increases this to 18, then a 17 on the attack roll is blocked by the shield. If the d6 rolls a 5 or 6, the damage is enough to break the shield; otherwise, the object can continue being used as a shield. This range can be increased or decreased based on the strength of the object used or the power of the attack blocked, if need be; this is simply a suggested method of handling improvised shield durability.*

The Best Defense

Also at 3rd level, you have practiced with using your shield for offensive purposes, should the need arise. Shields count as simple melee weapons for you. If your shield has a magic bonus, you can add that to the attack and damage rolls of your shield.

A standard shield deals 2d4 bludgeoning damage on a hit and has the *thrown (15/30)* and *returning* weapon property for you. When you throw your shield, you can unequip it without needing to use an action, and when you use the *returning* property, you can re-equip it as a free action.

A buckler deals 1d4 bludgeoning damage on a hit and has the *light* and *finesse* weapon properties.

A tower shield deals 2d4 bludgeoning damage on a hit and has the *heavy* weapon property.

Improvised shields deal 2d4 bludgeoning damage on a hit, but they have no weapon properties. A DM may rule that a particular object is similar enough to one of the other shield types and use those statistics, though.

If you are playing with the revised 2024 ruleset, shields share a single weapon mastery slot; that is, if you can use the weapon mastery property of one kind of shield, you can also use the weapon mastery properties of the other shields. Bucklers have the Graze weapon mastery, standard and improvised shields have the Topple mastery, and tower shields have the [] mastery.

Level 7:

Starting at 7th level, whenever you start your turn, you can grant allies within

Level 10:

Level 15:

Level 18:

Way of Tranquility (*Monk*)

Level 3:

HP increases by Wis mod per level? Gain temp hp equal to wis * monk level after rest?

Use a bonus action to search for your inner peace; while in this zen trance for one minute, you gain a bonus to your AC equal to your Wisdom modifier if you aren't wearing armor (Monk unarmored becomes 10+Dex+Wis+Wis). As an Action while in this trance, you can assume a defensive stance, heightening your senses and allowing you to react quicker to the world around you. Your Perception and Passive Perception gain a bonus equal to half your Monk level, and after using the action, you gain a number of additional reactions equal to your Wisdom modifier. These additional reactions can only be used for Deflect Missiles or Reflective Strike, detailed below. You can spend one additional ki point per round (not turn) to grant an additional reaction. While in this stance, Deflect Missiles does not require a ki point to throw the projectile back.

Reflective Strike: As a reaction to a melee attack roll against you or an ally within 5 feet, you can deflect the blow. Make an attack roll against the attacker, even if they are striking out of your own reach; if you beat their AC, you can reduce the damage from their attack by a roll of your MA dice plus your Dex. They also take that amount of damage as you counterstrike. If your attack roll is higher than their attack roll, they take bludgeoning damage equal to your Wisdom modifier. These two can stack. Instead of making

an attack roll, if you beat their AC, you can attempt to grapple or trip instead, using your Dexterity (Acrobatics) for the roll instead of the normal check.[?]

Level 3?:

You can manipulate your ki to tug on the emotions of those around you; as a bonus action, you can expend a ki point to force a target within 15 feet to make a WST; on a fail, they must either target you with their action or do nothing. Area of Effect instances, such as Fireball, still count as targeting you, as long as you are within the AoE.

Level 6:

When you successfully hit, trip, or grapple a creature with your Reflective Strike, you can expend a reaction [and a ki point] to make an additional attack against them; you cannot make another attack based on this additional attack.

Level 11:

When you damage a creature with a melee attack, you can draw forth some energy from it and use it to bolster your defenses; once per turn, when this happens, you can roll a Martial Arts die and add your Wis modifier, gaining temp HP equal to that roll. Temp HP doesn't stack tho.

Level 17:

Soul Steward Archetype (*Ranger*)

Soul Stewards walk the border between life and death, one foot in either world. They hunt down targets whose time has come or who have evaded the afterlife. They also serve as a deterrent for those who would seek to abuse the spirits of the dead, protecting the borders of the spirit plane and all its denizens. Likewise, should a spirit find itself determined to return to the land of the living without the goddess's permission, it is their job to stop the spirit—or to hunt it down if it escapes. It is important to note: a Soul Steward does not necessarily take issue with the undead or with necromancy; rather, their war is against those who would do harm to the souls of those departed, and to ensure that souls pass to the afterlife with no issues when their time has come.

You get an undead form and a living form. Living is your normal character, undead changes you to an Undead creature type and stuff. Also, you get a companion/pet. It is the opposite of your active form and changes when you change, marking you as a Soul Steward.

Level 3: Undead Visage (need better name):

You get an undead form to match your living form, making you more undead. You also learn the Find Familiar spell and can cast it as a ritual once per day with no components; your familiar also has a living and undead form, although the only difference is that an undead familiar takes damage from healing

spells and heals from necrotic damage instead. Your familiar is the opposite form of you at all times and changes when you change.

Level 3: Undead Magic:

You have learned to channel undeath through your magic. You can cast any ritual spell you know as a ritual. Additionally, you learn the Cure Wounds and Inflict Wounds spells, and ~~can cast each once per day without expending a spell slot.~~ You learn spells (always prepared, do not count against your prepared/learned spells, count as Ranger spells). 1st: cure wounds, inflict wounds, find familiar. 2nd: Speak with Dead, 3rd: Counterspell?, Dispel Magic

Level 3: Death Awaits All:

You have learned ways to ensnare the living and dead alike. Over ten minutes, you can set a magical trap in a 30-foot sphere; when a creature enters into the area, they must make a Constitution saving throw or take necrotic or radiant damage (you choose when you set the trap) equal to 1d10 for each three Ranger levels you have and be restrained for 10 minutes. A successful save only takes half damage and is not restrained. They can make a Constitution save at the end of their turn to try to break free. This trap lasts for 24 hours or until triggered, whichever comes first.

As an action, you can expend a spell slot to create a trap; this only lasts for one minute and the restrained condition also has a maximum duration of one minute.

Level 7: [Bloodrite/Invocation]

Level 11: Spellbreaker

Level 15:

Elemental Origin (*Sorcerer*) [needs rework]

Perhaps you come from an elemental heritage (most commonly a geniekin). Perhaps you were born in one of the elemental planes. Or maybe you simply find certain elements of magic to be easier to manipulate than others. Regardless of how you obtained your power, you resonate with a particular element. You can pick one of the four elements (Air, Earth, Fire, or Water); you automatically learn one damaging cantrip (firebolt but converted to your element? Or new cantrip for each element?) and one manipulate cantrip associated with that element, and you learn one or two spells automatically as you level up, up to 5th-level spells. ~~Can choose from Druid spell list as well when gaining future spells?~~ As an action, you can Unleash Elements and assume an elemental form for one minute (duration scales at higher levels)? Temp HP equal to your level, use melee spell attack to hit, can only cast spells given from

this origin, unless a DM approves alternative spells? I dunno. Gain a bonus to spells and weapon attacks equal to your Cha mod when you Unleash Elements and your spells deal damage of the same type as your element. Add Charisma to AC when Unarmored and Unleash Elements is active, as you embody your element type physically. ~~Martial and Simple weapon proficiencies~~, extra attack? When making unarmed strikes with an unleashed element, you deal relevant damage type and deal 1d8+Charisma mod for damage. Weapon attacks deal an additional 1d4 damage of the relevant damage type.

Elemental Spells:

You learn two cantrips based on your elemental origin (one offensive, one manipulative). You also learn one spell, 1st through 5th level, associated with your element. You can consult your DM if you would like to replace one of these spells with a similar one of the same level; for instance, a water elemental sorcerer might want to use frostbite instead of ray of frost. Generally, it is okay to substitute these, as long as they fit thematically; just make sure your DM is okay with it.

Additionally, you learn the Primordial language, as well as the dialect directly associated with your element.

LEVEL 1:

You gain the ability to Unleash Elements. As an action, you can unleash your elemental origin, assuming a form that attunes you to your chosen element for ten minutes or until you dismiss it as an action. You gain a number of temporary hit points equal to your Sorcerer level + your Charisma mod, and you gain a bonus to your AC equal to your Charisma modifier if you are not wearing armor. ~~The only spells you can cast when unleashed are the ones from your elemental spells (unless your DM approves of other spells);~~ spells that align with your element gain a bonus to their damage equal to your Charisma modifier, but you can only add this damage to one damage roll per turn. Additionally, your weapon attacks deal an additional 1d4 damage based on your element, and you can make an Elemental Slam attack as a melee unarmed strike; a Slam does 1d10+CHA damage based on your element. You are considered proficient with your Elemental Slam attack, and it uses your Sorcerer spell attack modifier for its attack rolls. You can Unleash Elements a number of times per day equal to your Proficiency Bonus; if you have sorcery points, you can expend one point to use this feature again.

LEVEL 6:

Your Unleash Elements improves. When you Unleash Elements, you can use the Multiattack action, making a number of Elemental Slam attacks based on your cantrip scaling (two Slams at this level, three at level 11, and four at level 17). When you multiattack, you can use your movement and bonus action in between your Slams, similar to the rules for taking the Attack action with Extra Attack. Additionally, you gain resistance to the damage type associated with your element while your element is unleashed.

You can also expend a sorcery point when you Unleash Element to unleash as a bonus action instead.

LEVEL 14:

Unleash Elements lasts for one hour. While your element is unleashed, you can choose to deal AoE damage around you equal to your CHA when enemy starts turn or enters for first time; additionally, within the AoE, your element provides a certain effect, such as slowing movement speed or something.

LEVEL 18:

Unleash Elements has no duration and can be used an unlimited number of times; you can switch freely. Additionally, once per day, you ~~can cast a non-elemental spell~~ have resistance to your element at all times, and immunity while your element is unleashed.

Shield Variants

This rule modifies the standard shield rules to add additional types of shields. In standard 5th edition D&D, there is only one kind of shield (outside of magic items). By adding additional shields as mundane equipment, it opens additional considerations and strategies for characters when deciding whether or not they should use a shield. The following variants of shields are added as mundane equipment, and standard magical variants (+1, +2, +3) are added for those that do not have them already.

Light shields. Light shields, known typically as bucklers, are smaller shields intended be used alongside larger weapons or wielded as a lightweight alternative to larger shields. Proficiency with a light shield can be gained automatically by having proficiency with both light armor and either martial weapons or standard (medium) shields; if you have proficiency with heavy shields, you automatically gain proficiency with light shields as well. Bucklers (the standard light shield variant) cost [] gp and weigh [] lbs. Functionally, they differ from medium shields by []

Medium Shields. Medium shields are the standard shield currently in D&D. Whenever a feature mentions a shield without a type, it can be assumed to be referring to medium shields; at the DM's discretion, the effects of those features can be extended and potentially modified to apply to heavy and light shields. Proficiency with both medium armor and martial weapons automatically grants proficiency with medium shields; gaining any shield proficiency also grants medium shield proficiency as well.

Heavy Shields. Heavy shields typically refer to tower shields; these are massive shields that provide substantially more cover than smaller, lighter variants. You can gain proficiency with heavy shields by having proficiency with both heavy armor and either martial weapons or standard (medium) shields; gaining proficiency with heavy shields automatically grants proficiency with light and medium shields. Tower shields (the standard heavy shield) cost [] gp and weight [] lbs. Functionally, they differ from medium shields by []

Integration (Augmentation?) System

(Both, allowing DM's to choose which option they want based on power level? Probably not?)

1. Designed to improve either a single character or a multitude of them, the Integration System is an optional system for a DM to grant players a power boost. Based off the Magnus class, the Integration system grants an Integration to characters. This allows a player to continue playing their preferred character while also giving them access to new abilities and an improvement to their combat capabilities. Characters under the [Magnus] system are generally more powerful than those that aren't, so generally, caution should be exercised when using it not uniformly. A Magnus who is given an Integration can either choose an additional subclass or can take the same subclass again; when a Magnus has two of the same subclass, a DM has final say on what abilities can stack and which ones cannot. For more details on the specifics of how this feature works, see the Magnus class.

Optionally, you can use this same concept to grant characters a subclass from a different class than Magnus. However, this could lead to unusual and complicated rulings, as those classes have not been designed to function separate from their base class, unlike the Magnus. Exercise caution when doing this, and be prepared for a variety of unprecedented questions. Subclasses of spellcasters increase your spellcasting to their level?

2. Adjustment: Grants characters a secondary class; does not grant ASI's from that class, cannot multiclass it—only gains the class features (subclass included). If spellcasting, does not improve base spellcasting progression unless integrated class has faster progression, IE artificer w/ wizard integration would gain spell slots/level at the rate of a wizard, but can only learn the spells of proper level based on each class (if arti can only prepare 2nd level spells, being level 5 wizard doesn't allow arti to prepare 3rd level arti spells, but can access 3rd level wiz spells). The Magnus class is designed with this system in mind, but expanding to other classes can cause unforeseen issues.

1b. The Magnus class is designed differently from other classes. While the class as a whole is intended to be able to stand alone and be fairly balanced, each individual subclass (Integration) is also designed to be capable of standing alone. If you want to run a game with a higher power level, particularly for martial characters, you can grant some or all of your players a particular subclass from this class—either your choice, or theirs. These additional subclasses, when used in this way, do not affect a character's leveling progression. Instead, they simply gain the features of these subclasses when this additional subclass would normally gain that feature, in addition to their normal subclass; treat their character level as though it was their level in this class. For instance, at 6th level, a Fighter would gain their normal ASI or feat, but they would additionally gain the 6th level feature from their particular Integration. However, they do not gain any other features or benefits from the class, since it is NOT multiclassing. This WILL make characters noticeably stronger than without using this, so be mindful of this.

When determining the DC of effects under an Integration feature, you may use your base class's relevant DC if it has one. If not, you may choose which Ability Score you wish to use for the DC.

Relationships/Social Growth System

relationships mechanics (how easy to influence someone is vs how stubborn? they are vs your interactions—some people might build trust more easily but it doesn't make a huge difference in how much their demeanor changes, while others are hard to build trust with and still don't offer much for it, while still others are very influenceable either from the start or after a long time, and some people make friends more easily. Some people lose trust easily and don't forgive much, if at all—there's tons of nuance to consider here) (different dice sizes/amounts to roll for each npc after each interaction? Based on or add player charisma? Counteracted/balanced by npc's resistance score? Could have starting values differ by character, and threshold to become more friendly differ as well, with various benefits offered based on friendship level; can also affect DC for various interactions. Leaning towards one dice + charisma for a neutral/positive interaction, 2 dice + cha for really good, and -1 dice + cha for bad)

Likely working version (will iterate to improve; if testing reveals flaws, may rework before finalization): In order to help players and NPCs have more interesting interactions and facilitate actual relationships between them, the SGS gives DMs a tool set to help gauge and track relationship progress, and offers ideas on how these developing relationships can be beneficial (or punishing) for player characters (as well as offer insights for DMs on how to play different NPCs and make them feel more unique). Below is the basic outline for how to use the SGS (and remember, just because it's a "relationship" system doesn't necessarily mean there's romantic connotations to all of this—but it also doesn't mean there *can't* be) (note: obviously, outlier interactions like brutally murdering an NPC's family or resurrecting their previously-deceased family members would bypass the whole SGS and have a lasting and notable impact on a character's relationship with that NPC and with others):

Every (important) NPC has several statistics (I would recommend a spreadsheet to keep track of them all, especially if you are running individual scores and not just party-wide ones).

1. The first is a Resistance Score—a modifier that conveys how difficult it is to make a positive impact on them. A RS is usually a small number, likely no larger than 6 (and can potentially be negative for particularly influenceable characters), with 3 or 4 being considered hard to influence. (For comparison, think of it like an anti-Charisma modifier, to determine how easily they resist influence—you never want to have this be disproportionate to what characters can have as a Charisma modifier.) The system is designed in a way that, even with a very high RS, players can still make progress in developing a relationship with an NPC; a high RS can never turn into negative progress, it is simply the NPC's resistance to a change in relationship.
2. The second is their Relational Die; this is the size of a dice you'd use when determining how much progress you gain or lose during an interaction—the die size reflects how much progress (or harm) can potentially come from an average interaction. RD are kind of like a weapon's damage die, so usually they will never be a d20 and will likely be around a d6 or d8 on average. [Note: Resistance score and relational die are kind of related and might not both be necessary—could maybe be simplified. The main mechanical purpose of having both is just to give DMs an additional dial to tweak with their NPCs; it sets an average and maximum growth value that can differ between characters. So maybe a character isn't particularly resistant to change, they just take their relationships slower—so they may have an RS of 1 but a RD of a d4, indicating

consistent growth but slow overall progress. The distinction is kind of hard to distinguish “lore-wise”, but maybe someone smarter than me can explain it better; understanding how these two factors could be different thematically and not just mechanically might help DMs be able to play their NPCs better.]

3. The third is their Social Gate/Interaction Threshold. This is the bare minimum total you need to achieve in order to make a positive impact. There are two parts to this—a negative number and a positive one [might be the same number?]. If your total is larger than the positive one or smaller than the negative one, you use your total when determining how much progress is made in the relationship. Otherwise, the progress made is determined by either your Charisma modifier for a positive interaction (minimum 1) or their Resistance Score for a negative one (also a minimum 1, meaning you always lose at least 1 point for a negative interaction).
4. The final statistic is the Standing score; this typically starts at 0 and refers to how the NPC perceives the party and/or player character (obviously, this score might be different if the NPC has heard of or interacted with a player character or party before the first in-game interaction). A DM can choose to use Standing either on an individual level, keeping track of every player character’s individual Standing with each NPC, or—for a simpler experience—just use a party-wide Standing score, treating every individual as though they had the same Standing as the rest of the party. If running individual Standings, party interactions with an NPC will benefit all party members, but not equally—those who actively participate in interactions will be able to roll for influence, while those who do not participate or only briefly participate instead will just treat the interaction as though they did not meet the Social Gate. For party interactions, allow the player character who “leads” the conversation to roll on behalf of the party; having multiple individuals interact can allow the leading player character (if there is one—or else allow the players to choose which of their characters should get to roll; often, the one with the highest Charisma leaves the biggest impression, so it’s okay if players metagame it a little bit—it makes sense in-game) to roll with advantage (unless the interactions from the rest of the party have a negative effect on the lead character’s interaction with the NPC—if the party isn’t actually Helping the player rolling, they cannot benefit from the assistance, and for particularly harmful input from the rest of the party, it could even impose disadvantage on the roll). [Advantage/Disadvantage isn’t really a thing for non-d20 rolls, but the concept is the same]. As Standing increases, it unlocks various benefits, which might be specific for that NPC. [Ideas for what it could look like: maybe at 15, the NPC’s Resistance Score decreases by 1, at 20 Charisma checks towards that character gain a +1 or the DC to beat is decreased by 1, at 25 a shopkeeper offers a 10% discount on their goods, at 40 an NPC might be able to start having feelings for a player character (if that’s a thing you do in your games), at 50 a weaponsmith starts actively searching for interesting magic weapons they think characters would like and offer to sell it to them first at a cheaper price for being friends, etc. Lot of possibilities to consider here. There should also be some negative consequences, albeit fewer. Maybe at -15 Standing, an NPC is unhappy to see you in their shop and raises the prices by 20% specifically for you, and at -30, you’re outright banned from the shop. There should be fewer negative consequences, but establishing that there are stakes is important.]

How to use the SGS: When players have a notable interaction with an NPC—something like buying from their shop or having a conversation with them, not just a brief “where’s the tavern kthxbai”—the player [or DM on behalf of the player?] gets to roll to determine how much their Standing with that NPC

changes (refer to “4. Standing” for party vs individual Standing rules). The DM must make a judgement call on the overall nature of the interaction: it can be a neutral/slightly positive/slightly negative interaction, a positive interaction, a negative interaction, or a very negative interaction. (Guidelines for making these calls: most interactions fall into the neutral category. A positive or negative interaction is one where you can look at the conversation and say without a doubt “that went well/poorly” from the NPC’s perspective—if you find yourself questioning it, it’s probably a neutral interaction. Very negative is reserved for interactions that are very bad and would likely have a lasting impact, like insulting or hurting a character or their family or getting into a screaming match with a shopkeeper because they won’t offer you a discount; very negative interactions could easily spiral into “outlier interaction” territory that would go outside the scope of this system, so you will very rarely ever use the Very Negative ruling.)

Based on this judgement call, the player (or DM) rolls the NPC’s Relational Die; for Very Negative and Positive, two dice are rolled, while Negative and Neutral only has one die rolled. For negative interactions, the number rolled (or total rolled for Very Negative) becomes a negative number, while neutral and positive interactions remain a positive number. The player character’s Charisma modifier (minimum 0) is then added to the total, and the NPC’s Resistance Score is then subtracted from the total. This total is then compared to the NPC’s corresponding Social Gate number; if the total is higher than their positive Gate, the total is then added to their Standing. Likewise, if it is lower than their negative gate, you would add the negative total to their Standing (or, in simpler terms: take the negative number that is their total, pretend it’s a positive number by removing the negative sign, and subtract that number from whatever their Standing was before this interaction). If the total fails to meet either Gate, their Standing is increased or decreased according to the rules mentioned in “3. Social Gate”. Once the interaction ends, the new Standing score takes effect—so if they meet a Standing level that unlocks the NPC doing things for them when they aren’t around, they will start doing that (if the NPC has time/resources to do so, of course) AFTER the interaction concludes—Standing and any of its benefits/consequences do not change the course of an interaction while it is happening.

For an easier-to-read guide, this is how the SGS formula works (the negatives interactions and numbers have been simplified for clarity):

Neutral Interactions:

$$1d(\text{Relational Die}) + \text{CHA (minimum 0)} - \text{RS (no minimum score)} = \text{Total}$$

$$\text{If Total is equal to or greater than PlusGate: New Standing} = \text{Old Standing} + \text{Total}$$

$$\text{If Total is lower than PlusGate: New Standing} = \text{Old Standing} + \text{CHA (minimum 1)}$$

Positive Interactions:

$$2d(\text{Relational Die}) + \text{CHA (minimum 0)} - \text{RS (no minimum score)} = \text{Total}$$

$$\text{If Total is equal to or greater than PlusGate: New Standing} = \text{Old Standing} + \text{Total}$$

$$\text{If Total is lower than PlusGate: New Standing} = \text{Old Standing} + \text{CHA (minimum 1)}$$

Negative Interactions:

$1d(\text{Relational Die}) + \text{RS (minimum 0)} - \text{CHA (no minimum score)} = \text{Total}$

If Total is equal to or greater than MinusGate: New Standing = Old Standing – Total

If Total is lower than MinusGate: New Standing = Old Standing – RS (minimum 1)

Very Negative Interactions:

$2d(\text{Relational Die}) + \text{RS (minimum 0)} - \text{CHA (no minimum score)} = \text{Total}$

If Total is equal to or greater than MinusGate: New Standing = Old Standing – Total

If Total is lower than MinusGate: New Standing = Old Standing – RS (minimum 1)

Key: CHA is the player's Charisma modifier. RS is the NPC's Resistance Score. PlusGate is the positive number associated with the NPC's Social Gate; MinusGate is the negative one, but you ignore the negative symbol when plugging it into these formulas.

(Note: The minimum values for each modifier were intentionally inconsistent. For positive interactions, a character's negative Charisma score should never be able to prevent them from making progress, while a negative Charisma score can still make a bad situation worse for the negative situations. Likewise, the NPC's Resistance Score has its minimum capped for negative interactions, as it should always result in the player losing at least 1 Standing for a negative interaction.)
